## ABSTRACT:

CHG DATE=19990617 STATUS=O>A household dish washer has sensors to assess the degree of contamination of the cleaning liquid and if it is too dirty, a change of water is instigated. The type of impurity is also indicated, as to whether the liquid contains suspended particles of egg white or starch, or other material. The indications are given by using injectors (8) filled with different solutions feeding metered amounts down a channel (9) to a trap chamber (7) for the cleaning liquid. Each trap chamber has an external sensor (11) to test the colour and/or intensity and send an information signal to the control electronics. When egg-white impurity is present in sufficient strength, there is a complete water change. If starch impurities are present, the cleaning liquid is raised in temperature and if enzyme-containing cleaners are used, the cleaning time is lengthened.

## BASIC-ABSTRACT:

A household dish washer has sensors to assess the degree of contamination of the cleaning liquid and if it is too dirty, a change of water is instigated. The type of impurity is also indicated, as to whether the liquid contains suspended particles of egg white or starch, or other material. The

indications are given by using injectors (8) filled with different solutions feeding metered amounts down a channel (9) to a trap chamber (7) for the cleaning liquid. Each trap chamber has an external sensor (11) to test the colour and/or intensity and send an information signal to the control electronics.

When egg-white impurity is present in sufficient strength, there is a complete water change. If starch impurities are present, the cleaning liquid is raised in temperature and if enzyme-containing cleaners are used, the cleaning time is lengthened.

ADVANTAGE - Cleaning program automatically adjusted to match degree of contamination.
